

February 4, 2026

Hi! My name is Colin Blesener, and as of the time I am writing this I am a junior in high school at Rochester Adams. In my portfolio you will find my resume, letters of recommendation, my credentials and certifications, projects I've worked on, evidence of career exploration, skill evaluation, and other miscellaneous information. I go to OSTC for the first half of my day to learn code and Rochester Adams for my basic education.

In my CTE program at OSTC I have acquired a certification in HTML and CSS. Knowing how to build a foundation with code will be essential and knowing how to style using CSS is very important to keep websites interesting. Currently I am working on getting certified in JavaScript as well so I can add interactivity to code which will definitely help when making games as my plan is to be a game developer

As stated in the last paragraph I want to be a game developer and knowing how to design a website will definitely be beneficial to me as games and websites both need to be engaging, interactive, and coherent. Being a game developer has been a big dream of mine as the idea of being able to create a unique experience that makes an impact on people's lives is very cool! It's a story that you get to interact with in your own way. I also just really like playing video games in general. Now while code may be a hard thing to learn due to all the many different commands you need to remember it's also just really fun to problem solve and I will keep at it until my dreams are in my reach.

In order to improve the probability of me being hired I will need a bachelor's degree in college practicing both common forms of code used on websites and games. While in college I will try to find possible jobs in managing how websites are laid out and styling them with CSS and JavaScript. In my free time I will practice coding games, and once I believe that my first game is finished I'll release it and it will become a side hustle for me until it is recognised and I fully switch over to game development as a job. My dream game is complex so I will probably also want to start a dev team in order for it to be possible. Regardless, I won't back down from this challenge as once my career starts it's go time!
